AB The invention discloses cyclosporin-series cyclic peptides whose ability to inhibit the protein phosphatase calcineurin and thus can act immunosuppressively can be switched off. Through modification of the hydroxyl group of [D-Ser]8 cyclosporin, the immunosuppressive effect of such cyclosporin derivs. can be turned off by means of suitable activatable substituents. Because therapeutically used dosages of cyclosporin A possess numerous undesired side effects, the value of invention consists in the fact that the immunosuppressive activity of the available cyclosporin derivs. can be turned off. The cyclosporin derivs. of the invention can also be therapeutically used with the underivatized compound. With the therapeutic application of the inventive switchable cyclosporin derivs., their effectiveness can be influenced during therapy.
